

DOMAINPX AGILE SUPPLIER PUSH DISCOVERY TOOL

Customizations and Enhancements for Agile PLM

The DomainPx Supplier Push Discovery Tool is process extension (PX) for Agile Product Lifecycle Management, which provides added functionality in order to drive component level and Approved Manufacturer List (AML) discovery access from the top level, down.

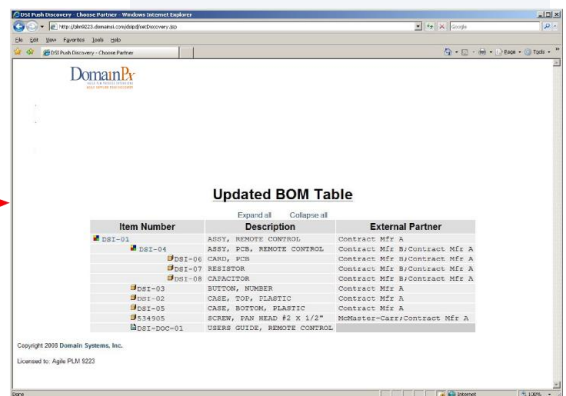

A Functional Overview

Push discovery may be a required functionality for internal and/or external partner level access to critical product related data. Agile customers often use a "Page Two Multi-List" field on items to control discovery of items by supply chain partners.

With the Supplier Push Discovery Utility tool, roles and privileges are configured such that partners are granted access to specific parts and meta-data based on Page Two fields. Agile users grant privileges to a partner by adding that partner to the Page Two field.

A common use case would be an Agile user wanting to add privileges for a partner to all items on a BOM. This could even include starting from a product's top-level assembly. The tool then grants privileges to all parts, including subassemblies beneath that top level assembly (TLA). Currently without this tool users are forced to navigate to each and every part then edit the Page Two attributes then resave the item.

The Domain Systems Supplier Push Discovery Utility starts from an assembly and looks down the BOM, automating changes to the Page Two attribute field, via the Agile SDK.

Agile Supplier Push Discovery Tool

- J2EE compliant web application to an application server.
- Uses existing Oracle Application Server installation required for Agile 9.x.
- Straight forward install accomplished in minutes.
- Cloud based application.
- Ability to configure as an Agile process extension.
- Ability to updated only specific BOM or, "where used."
- Filters for specific item sub-classes.
- Ability to add one or more partners.
